Day-9

## Inheritance in Java

Core Java

@7:30 PM Today

# Inheritance

The process of an object can acquire the properties of another class is said to be inheritance

Or

**Inheritance in Java** is a mechanism in which one object acquires all the properties and behaviors of a parent object.

**Class:** A class is a group of objects which have common properties. It is a template or blueprint from which objects are created.

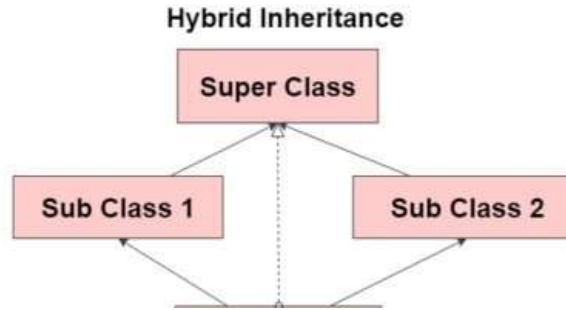

**Sub Class/Child Class:** Subclass is a class which inherits the other class. It is also called a derived class, extended class, or child class.

**Super Class/Parent Class:** Super class is the class from where a subclass inherits the features. It is also called a base class or a parent class.

**Reusability:** As the name specifies, reusability is a mechanism which facilitates you to reuse the fields and methods of the existing class when you create a new class. You can use the same fields and methods already defined in the previous class.

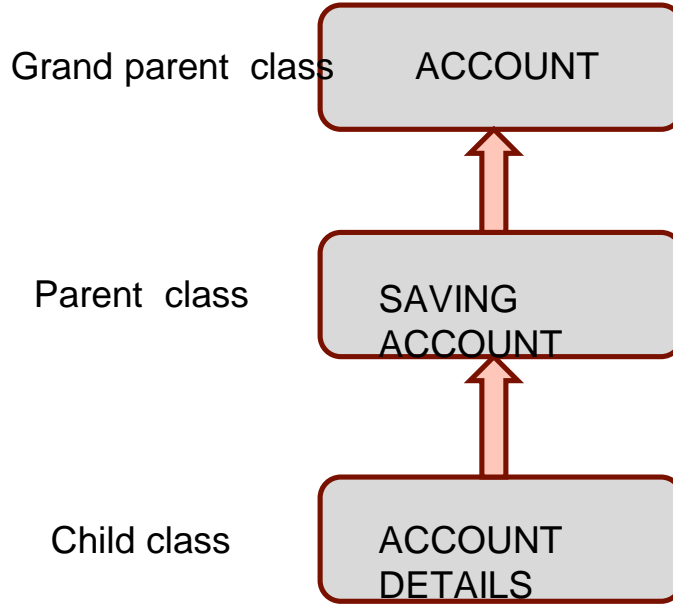

# Types of Inheritance

```
class Subclass name (dept)
extends
Superclass-
name (Employee)
{
    //methods and fields
}
```

Single Inheritance

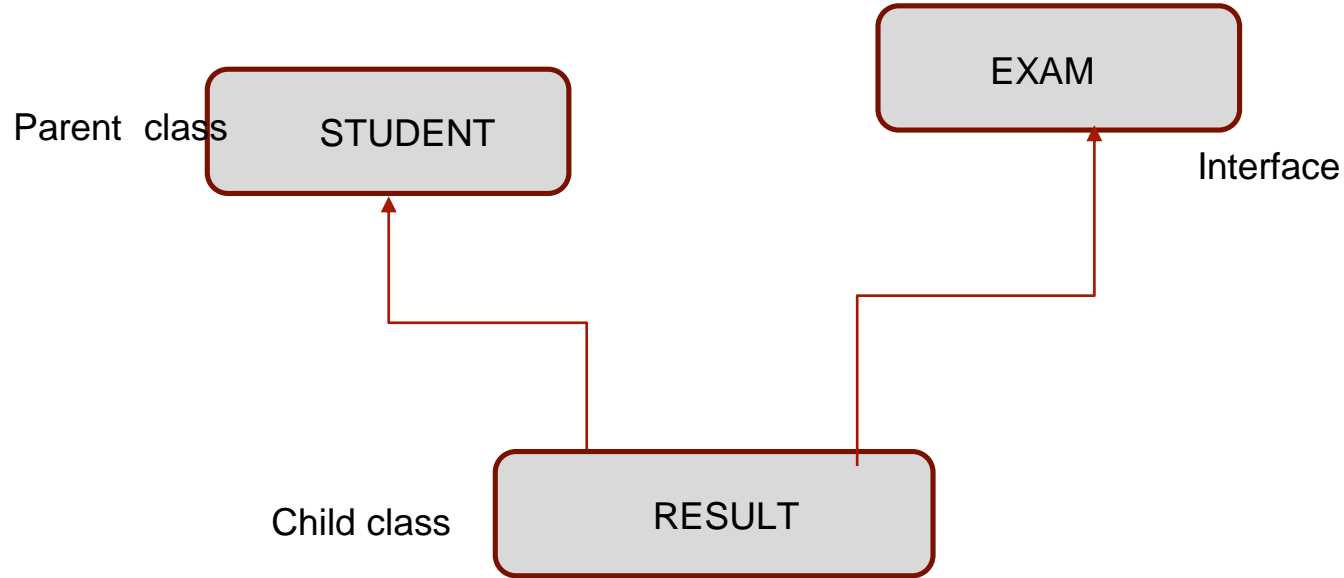

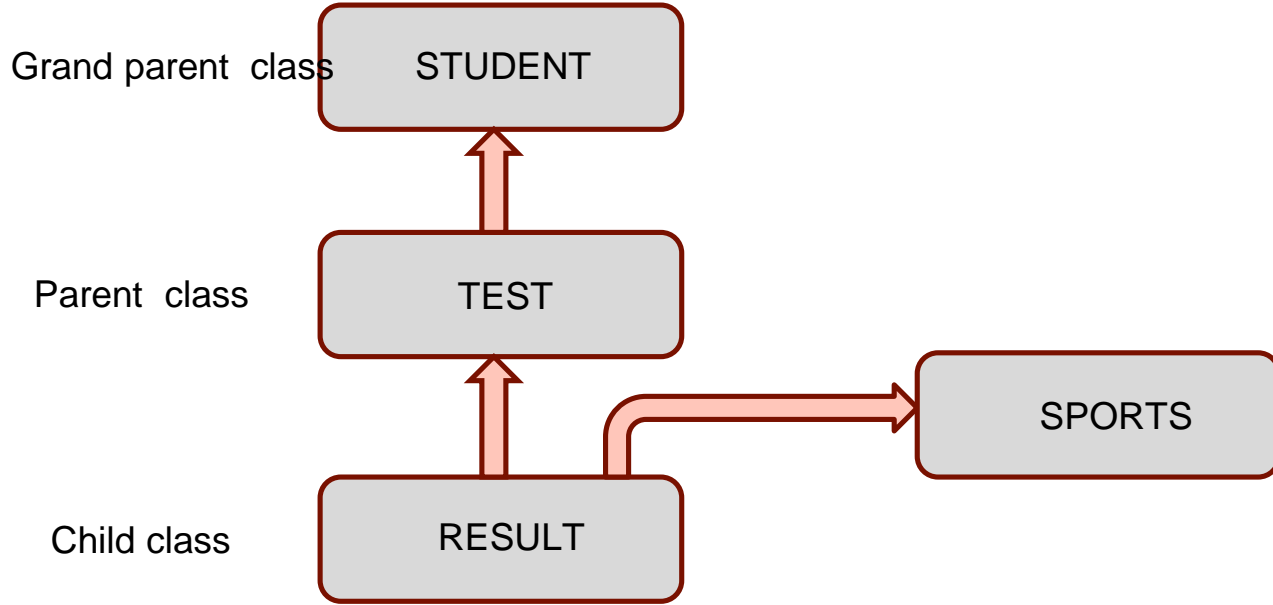

Multi-Level Inheritance

Hierarchal Inheritance

## Multiple Inheritance

Hybrid Inheritance
